a Saved execution states

An edge means a saved state can be restored.

Reuse requires both query and full prefix.

b AgentUCT: price a complete reward

$$I_t(p,a) = Q_t(pa) + c\sqrt{\log(N_t(p)+1)/N_t(pa)} - \beta\,\widehat{b}_t(p,a)/C_{\text{ref}}$$

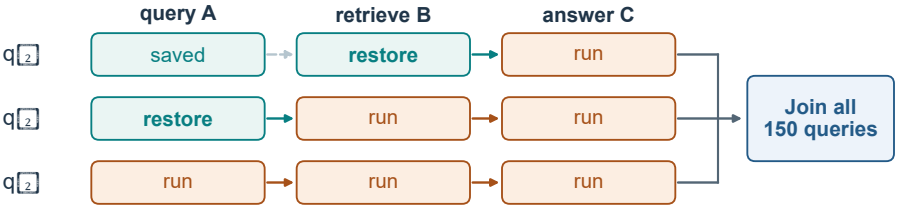

Forecast the remaining bill of 16 sampled legal completions.

Condition on current saved prefixes and learned physical prices.

Unvisited children first; rollout-only prefixes receive no tree backup.

c WTB executes x; one panel joins before backup

Same retrieve B after query B cannot supply query A's suffix.

One mean F1 → one raw backup; update prices and continuation counts.

Expanded ancestors: N ← N + 1, S ← S + F1, Q ← S / N.

Conceptual structure, not observed search depth. Three of 150 queries shown; WTB saves successful prefixes during execution.
